(a) $D \sim \Delta$, $H \sim \Delta \ln(1/\Delta)$ ($m = 4$, Gaussian)
disequilibrium D
normalized entropy H
quantization step Δ
D exact
$D_0 - c/(m-2)!$
H exact
H leading term only
H two-term law
(b) Coefficients universal; density enters only via $\int f^2$
$(H - H_0)\ln M/[c\ln(1/c)] \to 1/2$
normalized leading coefficient
$(D_0 - D)/c \to 1/(m-2)!$
noise density
Gaussian
Laplace
Uniform
$1 + (1 - \ln m)/\ln(1/c)$
quantization step Δ
